

INVITED TALK / ABSTRACT

Convergence and Orientability in RCD and Kato Spaces

Raquel Perales

CIMAT

Abstract

In this talk, we study convergence and define orientability via metric currents for two important classes of metric measure spaces: non-collapsed RCD spaces and non-collapsed strong Kato limit spaces. Under some assumptions, we show that orientation is preserved under pointed Gromov–Hausdorff convergence. Moreover, we show that, for both classes of spaces, the pointed Gromov–Hausdorff limit agrees with the local intrinsic flat limit.

Keywords: orientability; metric currents; non-collapsed RCD spaces; non-collapsed strong Kato limit spaces; pointed Gromov–Hausdorff convergence; local intrinsic flat convergence
