

INVITED TALK / ABSTRACT

Some recent existence and regularity results of the Brakke flow

Abstract

In this talk, I present a few recent results related to the Brakke flow which is a generalized mean curvature flow in the setting of geometric measure theory. In particular, I explain (1) the definition of Brakke flow with forcing and its existence and regularity properties (near flat part and near triple junction), (2) an existence of non-trivial Brakke flow starting from singular minimal surface.

Keywords: Brakke flow; mean curvature flow; geometric measure theory; forcing; existence; regularity; singular minimal surface
